### Presentation Title

Samy Braik

April 29, 2025

We denote by p the target distribution and q an easy-to-sample distribution, for example a centered Gaussian.

#### Diffusion

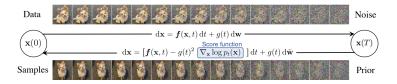

Let  $X_0 \sim p$ . We want to add noise until we reach pure noise, and denoise it afterward. We choose an horizon of time  $T \in \mathbb{N}^*$  and a noise schedule  $\beta : [0, T] \to \mathbb{R}^*$ , continuous and non decreasing.

### Forward process

$$d\overrightarrow{X}_{t} = \frac{-\beta(t)}{2\sigma^{2}}\overrightarrow{X}_{t}dt + \sqrt{\beta(t)}dB_{t}, \quad \overrightarrow{X}_{0} \sim p$$

### Backward process

$$d\overleftarrow{X}_{t} = \left(\frac{\beta(T-t)}{2\sigma^{2}}\overleftarrow{X}_{t} + \beta(T-t)\nabla\log p_{T-t}\left(\overleftarrow{X}_{t}\right)\right)dt + \sqrt{\beta(T-t)}dB_{t}, \quad \overleftarrow{X}_{0} \sim p_{T}$$

We learn the score by using score-matching techniques Score matching

$$\mathcal{L}_{\mathsf{score}}( heta) = \mathbb{E}\left[\left\| s_{ heta}\left( au, \overrightarrow{X}_{ au}
ight) - \log p_{ au}\left(\overrightarrow{X}_{ au}|X_{0}
ight)
ight\|^{2}
ight]$$

Plug it in the backward process and generate by discretizing the dynamics.

## Normalizing flow

Let  $X_0 \sim q$  and  $X_1 \sim p$ . We want to learn  $f_\theta$  such that  $X_1 \simeq f_\theta(X_0) = Z \sim p_Z$ . To do that, we set a structure on  $f_\theta$ , with  $f_1, \ldots, f_k$  simpler function (all parametrized by  $\theta$ ) such that

$$f_{\theta} = f_1 \circ f_2 \circ \ldots \circ f_k$$

We determine  $f_{\theta}$  by minimizing

$$\mathcal{L}_{\mathsf{NF}}(\theta) = \mathbb{E}\left[-\log p_{\mathsf{Z}}(f_{\theta}(x)) - \log \left|\det \frac{\partial f_{\theta}}{\partial x}(x)\right|\right]$$

### Flow

A flow is time dependant function  $\phi_t : [0,1] \times \mathbb{R}^d \to \mathbb{R}^d$ . Using that we can define a flow model by applying a flow to  $(X_0, X_1)$ 

$$X_t = \phi_t(X_0, X_1) \quad t \in [0, 1], X_0 \sim p, X_1 \sim q$$
 (1)

Alternatively, by introducing a velocity field  $v_t:[0,1]\times\mathbb{R}^d\to\mathbb{R}^d$  the flow can be defined with the following ODE

$$\begin{cases} \partial_t \phi_t(x) &= v_t(\phi_t(x)) \\ \phi_0(x) &= x \end{cases}$$
 (2)

## Flow matching

# Comparison

| Models           | Pros  | Cons                      |
|------------------|---|---------------------------|
| Diffusion        | 1.2   |                           |
